EXCEPTION HANDLING

To find whether a digit lies in the specified range(1-100). Handling exceptions for invalid inputs and out-of-range numbers .

Input Format:

User inputs a number.

Output Format:

Confirm the input or print an error message if it's invalid or out of range.

For example:

Input	Result
1	Valid input.
101	Error: Number out of allowed range
rec	Error: invalid literal for int()

Program:

```
try:
  a=input()
  if(int(a)>0 and int(a)<101):
    print("Valid input.")
  else:
    print("Error: Number out of allowed range")
except:
  print("Error: invalid literal for int()")
```

	Input	Expected	Got	
✔	1	Valid input.	Valid input.	✔
✔	100	Valid input.	Valid input.	✔
✔	101	Error: Number out of allowed range	Error: Number out of allowed range	✔

Write a Python program that performs division and modulo operations on two numbers provided by the user. Handle division by zero and non-numeric inputs.

Input Format:

Two lines of input, each containing a number.

Output Format:

Print the result of division and modulo operation, or an error message if an exception occurs.

For example:

Input	Result
10 2	Division result: 5.0 Modulo result: 0
7 3	Division result: 2.3333333333333335 Modulo result: 1
8 0	Error: Cannot divide or modulo by zero.

Program:

```
try:
  a=input()
  b=input()
  c=int(a)/int(b)
  d=int(a)%int(b)
except ZeroDivisionError:
  print("Error: Cannot divide or modulo by zero.")
except:
  print("Error: Non-numeric input provided.")
else:
  print("Division result:",c)
  print("Modulo result:",d)
```

	Input	Expected	Got
✔	10 2	Division result: 5.0 Modulo result: 0	Division result: 5.0 Modulo result: 0
✔	7 3	Division result: 2.3333333333333335 Modulo result: 1	Division result: 2.3333333333333335 Modulo result: 1
✔	8 0	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.
✔	abc 5	Error: Non numeric input provided.	Error: Non numeric input provided.

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

Input Format: A single line input representing the user's age.

Output Format: Print a message based on the age or an error if the input is invalid.

For example:

Input	Result
twenty	Error: Please enter a valid age.
25	You are 25 years old.
-1	Error: Please enter a valid age.

Program:

```
try:
  a=input()
  if int(a)>=0:
    print("You are",a,"years old.")
  else:
    print("Error: Please enter a valid age.")
except:
  print("Error: Please enter a valid age.")
```

	Input	Expected	Got	
✔	twenty	Error: Please enter a valid age.	Error: Please enter a valid age.	✔
✔	25	You are 25 years old.	You are 25 years old.	✔
✔	-1	Error: Please enter a valid age.	Error: Please enter a valid age.	✔
✔	150	You are 150 years old.	You are 150 years old.	✔
✔		Error: Please enter a valid age.	Error: Please enter a valid age.	✔

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

Input Format:

User inputs a number.

Output Format:

Print the square root of the number or an error message if an exception occurs.

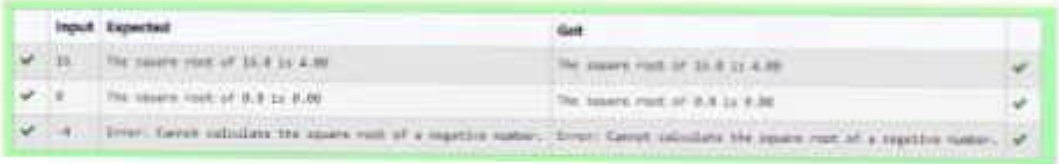
For example:

Input	Result
16	The square root of 16.0 is 4.00
-4	Error: Cannot calculate the square root of a negative number.
rec	Error: could not convert string to float

Program:

```
import math
try:
  n=input()
  n=float(n)
  if n < 0:
    print("Error: Cannot calculate the square root of a negative number.")
  else:
    r= math.sqrt(n)
    print("The square root of {} is {:.2f}".format(n, r))

except ValueError:
  print("Error: could not convert string to float")
```



Develop a Python program that safely performs division between two numbers provided by the user. Handle exceptions like division by zero and non-numeric inputs.

Input Format: Two lines of input, each containing a number.

Output Format: Print the result of the division or an error message if an exception occurs.

For example:

Input	Result
10 2	5.0
10 0	Error: Cannot divide or modulo by zero.
ten 5	Error: Non-numeric input provided.

Program:

```
try:
   a=input()
   b=input()
   c=float(a)/float(b)
except ZeroDivisionError:
   print("Error: Cannot divide or modulo by zero.")
except:
   print("Error: Non-numeric input provided.")
else:
   print(c)
```

	Input	Expected	Got	
✔	10 2	5.0	5.0	✔
✔	10 0	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.	✔
✔	ten 5	Error: Non-numeric input provided.	Error: Non-numeric input provided.	✔
